

INVENTRA, IN PLAIN ENGLISH

What happens before Inventra ever buys anything

Whenever the system thinks a product might run out, it walks through the same six checks — automatically, in order — before a single dollar is spent.

The system can say no on its own. It can never say yes on its own — a named person has to approve every purchase.

The six checks

Steps 1–3 and 5–6 run automatically. Step 4 always waits for a person.

1

Is this product actually running low?

The system looks at how much stock is on hand and how fast it's selling. If coverage is healthy, the journey stops right here — nothing else happens.

2

Who can supply it, and how fast?

Real suppliers are compared on price, delivery time, and track record — never on their own sales pitch.

3

Does this fit our budget and rules?

The order is checked against what's left in this month's budget. and

against the company's buying policy.

4

A named person signs off

Everything gathered so far — the numbers, the supplier choice, the cost — is shown to a human. Nothing moves forward until someone approves it by name.

The only step that waits on a person

5

One last check before buying

Approval can sit for a while. Right before the order is placed, the system quietly re-checks that the price, stock, and budget haven't changed while it waited.

6

The order is placed — safely, once

Only now is the purchase actually created. A built-in safeguard means it's never accidentally placed twice, even if the approval is confirmed more than once.

How every journey can end

Every case lands in exactly one of these four places.

No action needed

Stock was healthy at step 1 — nothing to do.

More information needed

Something was missing or unclear, so the system asks rather than guesses.

Stopped

A check failed — old data, no reliable supplier, over budget, or a person said no.

Order placed

Every check passed and a person approved it.

Every step leaves a paper trail — who checked what, and when.

If a manager ever asks "why did this happen," the answer is always on record.

A plain-language view of the Inventra reorder process.
